**Section 1 Building Blocks of the Atom**

1 Atom The smallest unit of an element that retains the chemical properties of that element  
3 Element A pure substance consisting of only one type of atom  
Proton A subatomic particle with a positive charge found in the nucleus of an atom  
Neutron A subatomic particle with no charge neutral found in the nucleus of an atom  
Electron A subatomic particle with a negative charge that orbits the nucleus of an atom  
Atomic number The number of protons in the nucleus of an atom which defines the element  
Mass number The total number of protons and neutrons in the nucleus of an atom  
2 Atomic number defines the element and is equal to the number of protons  
Mass number represents the total number of protons and neutrons and it can vary for isotopes of the same element  
3 The number of protons is equal to the

atomic number The number of neutrons is calculated by subtracting the atomic number from the mass number The number of electrons is equal to the number of protons in a neutral atom

| Element  | Atomic Number | Mass Number | Number of Protons | Number of Neutrons | Number of Electrons |
|----------|---------------|-------------|-------------------|--------------------|---------------------|
| Carbon   | 6             | 12          | 6                 | 6                  | 6                   |
| Oxygen   | 8             | 16          | 8                 | 8                  | 8                   |
| Nitrogen | 7             | 14          | 7                 | 7                  | 7                   |
| Helium   | 2             | 4           | 2                 | 2                  | 2                   |

5 An isotope is an atom of an element that has the same number of protons but a different number of neutrons resulting in a different mass number For example Carbon<sup>12</sup> and Carbon<sup>14</sup> are isotopes of carbon

6 Isotopes have various applications in science and technology including

- Radioactive dating Used to determine the age of fossils and artifacts
- Medical imaging Used in diagnostic procedures like PET scans
- Nuclear energy Used as fuel in nuclear power plants
- Scientific research Used to study chemical reactions and biological processes

Section 2 The Atoms Structure

7 Diagram of an atom with labels

8 The nucleus is the dense positively charged center of an atom consisting of protons and neutrons

9 Energy levels or electron shells are regions around the nucleus where electrons are most likely to be found

Electrons with higher energy levels are further from the nucleus

10 Each energy level can hold a specific number of electrons

1st level  $n=1$  2 electrons

2nd level  $n=2$  8 electrons

3rd level  $n=3$  18 electrons

11 The higher the energy level the further the electrons are from the nucleus

12 An orbital is a three-dimensional region of space within an energy level where an electron is most likely to be found

An energy level can contain multiple orbitals

13 The electron cloud represents the space occupied by electrons around the nucleus It determines the atoms size and its ability to interact with other atoms influencing chemical bonding

Section 3 Atomic Models Through Time

14 Key features of atomic models

Daltons Atomic Model Proposed that atoms are indivisible spheres the foundation of modern atomic theory

Thomsons Plum Pudding Model Suggested a positively charged sphere with negatively charged electrons embedded within it

Rutherfords Nuclear Model Discovered the nucleus by observing the scattering of alpha particles Proposed a positively charged nucleus surrounded by orbiting electrons

Bohrs Model Introduced the idea of quantized energy levels and electron orbits around the nucleus

Quantum Mechanical Model This is the most accurate and current model describing electrons in terms of probabilities and wave functions

15 Strengths and limitations of models

Daltons Model Strength Established the foundation for modern atomic theory Limitation Didn't consider the internal structure of atoms

Thomsons Model Strength Proposed the existence of electrons Limitation Incorrectly placed electrons within a positively charged sphere

Rutherfords Model Strength Discovered the nucleus and proposed the planetary model of electrons orbiting the nucleus Limitation Didn't explain the stability of atoms

Bohrs Model Strength Introduced the idea of quantized energy levels Limitation Didn't explain the complex behavior of electrons in multielectron atoms

5 Quantum Mechanical Model Strength Provides a more accurate description of atomic behavior and electron configuration Limitation Complex mathematical framework is challenging to visualize

16 Current understanding of the atom The current model acknowledges that electrons occupy orbitals which are regions of space where there is a

high probability of finding an electron rather than fixed orbits It emphasizes the wavelike nature of electrons and describes their behavior using quantum mechanics Section 4 Applications of Atomic Structure 17 The atomic structure of an element determines its chemical properties through Number of valence electrons The electrons in the outermost energy level which participate in chemical bonding Electron configuration The arrangement of electrons in different energy levels and orbitals Electronegativity The tendency of an atom to attract electrons in a chemical bond 18 Understanding atomic structure is crucial in comprehending the behavior of elements in chemical reactions because it explains How atoms form bonds The sharing or transferring of electrons to achieve a stable electron configuration The types of bonds formed Ionic bonds transfer of electrons or covalent bonds sharing of electrons The reactivity of elements The tendency of an element to participate in chemical reactions based on its electron configuration 19 Technological advancements due to atomic structure Semiconductors Understanding the electron configuration of silicon and germanium allows the development of transistors and integrated circuits fundamental components of modern electronics Nanotechnology The manipulation of materials at the atomic level enabled by understanding atomic structure leads to advancements in materials science medicine and electronics 20 Current research area Quantum computing Researchers are investigating the use of quantum phenomena like superposition and entanglement at the atomic level to develop new types of computers with significantly higher processing power than traditional computers Bonus Question 6 21 A quantum leap in the context of atomic structure refers to the abrupt transition of an electron from one energy level to another absorbing or releasing a specific amount of energy in the process It is not a continuous movement but a discrete jump This worksheet should provide a solid foundation for your understanding of atomic structure Dont hesitate to refer back to your textbook or other resources for additional information and clarification Good luck

master s thesis from the year 2008 in the subject environmental sciences grade passed assumption university of thailand college of internet distance education side school of business administration course master thesis project language english abstract this thesis presents a research project entitled a hypothetical enhanced renewable energy utilization ereu model for electricity generation in thailand this research is motivated by thailand s rapidly increasing electricity consumption caused by the country s long standing above average economic growth consequently the rising electricity demand can only be satisfied by continuously growing electricity imports and thus creating a significant burden to thailand s national budget further more thailand is heavily dependent on natural gas reserves for electricity generation however these are expected to be depleted within only three decades and global price levels for conventional fuels are increasingly volatile with an ascending tendency as well therefore thailand faces an urgent need to strategically plan for the broad utilization of domestic renewable energy resources which is essential for a more diversified and thus sustainable electricity generation as well as for the nation s endeavor to become an energy hub within the south east asian region under these

circumstances this research conducts a comprehensive literature review regarding the past development as well as the current situation of renewable energy utilization in Thailand which concludes in the identification of the importance of renewable energy in the given context and closes with both a distinctive need assessment and a conceptual framework for Thailand's future renewable energy strategy. Subsequently, the research introduces a unique primary research endeavor in the form of an explorative expert interview survey which succeeds in a substantial collection of qualitative and in-depth data. These valuable data are first objectively analyzed and second subjectively interpreted and summarized to become the major source for the derivation of a multitude of potential strategic recommendations for an enhanced future renewable energy utilization development in Thailand. Finally, the entirety of these recommended strategic approaches based on both the secondary and primary research are assembled to develop the enhanced renewable energy utilization model for electricity generation in Thailand as the fundamental finding of this thesis and research project respectively.
