Immunology is a branch of biology that covers the study of immune systems in all organisms. Cellular immunology is the study of the cells and molecules of an organism's immune system.

the field involves studying how those different cells and molecules work together to provide a defense against different types of pathogens to better understand cellular immunology researchers study both healthy immune systems and those that are actively fighting off pathogens comparing the differences and similarities of how the immune system's cellular physiology operates molecular immunology is a subfield of immunology that aims to examine immune processes at a molecular level the immune system is the bodily system that responds to foreign entities such as bacteria or other infectious agents in the body the immune response that such a foreign entity triggers tends to be highly specific the body produces antibodies that are specifically designed to target a particular antigen or foreign body that triggers an immune response just as a single lock tends to be matched to a single key the field of molecular immunology exists to examine this and other aspects of immune response that are controlled at a molecular level immunology is a fast evolving subject and attempt has been made in this work to keep it as much up to date as possible according to the requirement of the students and researchers in the field this book reviews the principles of immunology and provides basic concepts of it by extracting the important information on immunology and presents it in a concise uncluttered fashion to prepare students for their courses

the distinction between molecular immunology and immunobiology is necessarily arbitrary the most rapid progress is usually made in the blurred area between the two when the chemist is aware of the full significance of the biological problems and the biologist is alert to the contribution that a knowledge of molecular structure can be made to their solution the range of scientific disciplines able to contribute to research in immunology which this approach brings is reflected in the present volume protein chemists worked out the arrangement of the polypeptide chains and the amino acid sequences of antibodies and x ray crystallographers the three dimensional structure but more precise definition of the amino acid side chain positions in the combining site is required for an understanding of the subtleties of antibody specificity that this can be achieved with physical techniques such as nuclear magnetic resonance has been shown by r a dwek and in his chapter he summarizes these results with a minimum of technical detail the immune response has been shown to be dependent on complex cellular interactions and further progress will be facilitated by investigation of the molecular basis of these interactions this necessitates study of the structure and organization of the molecules in the surfaces of lymphocytes and other cells

this textbook aims to describe in a condensed form the essentials of molecular immunology behind bacterial infections the microbiome viral infections such as influenza and covid 19 organ transplantations autoimmunity allergy and tumor immunology the book emphasizes the impact of immunology in maintaining our health and preventing disease our immune system protects us not only from severe consequences of infectious diseases and getting cancer but is also able to harm us severely via sepsis cytokine storms and anaphylactic shocks molecular understanding of immunology should allow the reader a more rational handling of common diseases most of which are associated with chronic inflammation

provides the requisite basis for a research career in this fast developing field book jacket

there are many unanswered questions regarding the molecular nature of antibodies components of complement and other substances which participate in the immune response the list of substances which need to be analyzed chemically is increasing plasma cell products of course have long been of great interest because the most prevalent ones are immunoglobulins other cell types however are the source of the broad spectrum of additional substances which classically fall into the sanctum of the molecular immunologist it is these substances and especially those more recently discovered which are responsible for the broadening investigative interests of immunologists in this volume we have provided you with descriptions of research being done with immunoglobulins and with complement additionally we have included two reports that deal with molecules which are among the more recent acquisitions of the molecular immunologist the components of complement are known to react in a cascading manner which results in the lysis of cellular antigens the first step in the classical pathway requires the activation of C_3 by the antibody antigen aggregates this volume of contemporary topics in molecular immunology begins with the report of Reid and Porter which describes their investigation of the mechanism of activation of C_3 their descriptions of C_3 and of the reaction of C_3 with immunoglobulins are especially intriguing it is clearly apparent from their report that activation of the components of complement is a complex phenomenon
