excerpt from melting and boiling point tables vol 1 as is well known two of the most characteristic properties of substances are the temperatures at which they melt and boil and indeed as regards organic compounds are those properties by means of which these bodies are most easily recognised and their degree of purity ascertained they are therefore almost always the properties to which the chemist first directs his attention when dealing with a new or unknown compound and their determination consequently becomes of the greatest importance for both theoretical and practical purposes it therefore appeared probable that the publication of the enormous mass of data which had been collected in the tables would be a great convenience to

chemists and especially to those working with compounds of carbon this is more particularly the case as the data referring to many comparatively rare compounds are extremely difficult to find whilst those relating to the same substance not unfrequently vary between somewhat wide limits so that it is very desirable to have all the available data tabulated for comparison accompanied by references to the original papers about the publisher forgotten books publishes hundreds of thousands of rare and classic books find more at forgottenbooks.com this book is a reproduction of an important historical work forgotten books uses state of the art technology to digitally reconstruct the work preserving the original format whilst repairing imperfections present in the aged copy in rare cases an imperfection in the original such as a blemish or missing page may be replicated in our edition we do however repair the vast majority of imperfections successfully any imperfections that remain are intentionally left to preserve the state of such historical works
