there are many books on computers networks and software engineering but none that integrate the three with applications integration is important because increasingly software dominates the performance reliability maintainability and availability of complex computer and systems books on software engineering typically portray software as if it exists in a vacuum with no relationship to the wider system this is wrong because a system is more than software it is comprised of people

organizations processes hardware and software all of these components must be considered in an integrative fashion when designing systems on the other hand books on computers and networks do not demonstrate a deep understanding of the intricacies of developing software in this book you will learn for example how to quantitatively analyze the performance reliability maintainability and availability of computers networks and software in relation to the total system furthermore you will learn how to evaluate and mitigate the risk of deploying integrated systems you will learn how to apply many models dealing with the optimization of systems numerous quantitative examples are provided to help you understand and interpret model results this book can be used as a first year graduate course in computer network and software engineering as an on the job reference for computer network and software engineers and as a reference for these disciplines

failure often presents a valuable learning opportunity however students may need motivational scaffolds to protect them from the negative psychological ramifications of failure this work explored the effectiveness of a motivation based intervention called an ego protective buffer epb that was designed to enhance persistence after failure an ego protective buffer epb maintains a stable sense of competence by lessening the impact of failure on one s psyche the specific instantiation of an epb tested here was designed to elicit a combination of internal and external attributions for failure external attributions protect one s sense of competence by averting the blame for failure away from the self while internal attributions encourage students to take some responsibility for remedying the failure situation based on this theory we embedded an epb into the rule structure of a computer based genetics game and unleashed it on 143 seventh graders in the epb condition students were told that winning in the game was a probabilistic outcome dependent on a combination of chance and skill on the part of the students in the control condition students were told that winning in the game was a deterministic outcome dependent on students skill only students played the game during two class periods measures include pre and posttests motivational survey measures and in game behaviors the epb did have an effect on learning but only amongst high failing students high failing epb students learned just as much as their low failing counterparts this was not so in the control condition where high failing students learned far less than their low failing counterparts so the high failing epb group was behaving as if they were buffered from the effects of failure we also found evidence of a possible mechanism behind this learning effect in the high failing epb condition students were equally likely to persist after success and failure while in the control condition students were far more likely to persist after success exhibiting risk averse behaviors this difference was more exaggerated in a within subjects comparison contrasting the same individuals in situations of high and low failure finally persistence after failure was associated with learning across the full sample of subjects regardless of condition or failure rate students who persisted more after failure also learned more this study together with the author s related body of work provides compelling evidence that an epb is a viable intervention for encouraging persistence in the face of failure
