this thesis addresses data driven analysis as well as prediction based design of aperiodic sampling in control systems in many modern control applications the traditional view of sampling and controlling in a periodic fashion must be abandoned due to varying transmission delays data loss or uneven computational latencies the effect of these undesired aperiodicities on the closed loop must thus be analyzed in addition a targeted aperiodic design of the sampling pattern e g via event triggered control etc often allows for a better usage of bandwidth than periodic concepts we consider both perspectives in this thesis in particular first we provide methods to analyze stability of control systems under arbitrary aperiodic sampling directly from recorded data previous approaches to this end required model knowledge which might be challenging to obtain second we propose a prediction based approach for design of

the aperiodic sampling pattern called rollout etc this approach allows for predictability of the required communication resources and a guarantee of improved sample efficiency which were both difficult to address in existing etc schemes

the explosion of traffic over data communications networks has resulted in a growing demand for quality of service qos techniques to ensure network reliability particularly in regard to e commerce applications written by two experts in the field this book covers the implementation of qos techniques from an engineering point of view readers will find practical up to date coverage of all key qos technologies real world engineering examples illustrating theoretical results and a discussion of new control techniques for the next generation multimedia networks market electrical engineers and computer scientists involved with high speed networks
