the roots of this book and of the new research field that it defines lie in the scaling of vlsi technology with gigahertz system clocks and ever accelerating design and process innovations interconnects have become the limiting factor for both performance and density this increasing impact of interconnects on the system implementation space necessitates new tools and analytic techniques to support the system designer with respect to modeling and analysis the response to interconnect dominance is evolutionary atomistic and grain level models of interconnect structure and performance models at multi gigahertz operating frequencies together guide the selection of improved materials and process technologies e.g. damascene copper wires low permittivity dielectrics previously insignificant effects e.g. mutual inductance are added into performance models as older approximations e.g. lumped capacitance gate load models are discarded however at the system level and chip planning level the necessary response to interconnect dominance is revolutionary convergent design flows do not require only distributed rlc line models repeater awareness uniformations with extraction and analysis etc rather issues such as wiring layer assignment and early prediction of the resource and performance envelope for the system interconnect in particular based on statistical models of the system interconnect structure also become critical indeed system level interconnect prediction has emerged as the enabler of improved interconnect modeling more cost effective system architectures and more productive design technology

analysis of large deformation rigid body movement and strain or stress for discontinuous materials is often required for project designs and plans in the fields of engineering and disaster prevention many numerical simulation and analysis methods have been developed for the requirement from science and technology people since 1970s among them d
