computational complexity is a serious bottleneck for the design process in virtually any engineering area while migration from prototyping and experimental based design validation to verification using computer simulation models is inevitable and has a number of advantages high computational costs of accurate high fidelity simulations can be a major issue that slows down the development of computer aided design methodologies particularly those exploiting automated design improvement procedures e g numerical optimization the continuous increase of available computational resources does not always translate into shortening of the design cycle because of the growing demand for higher accuracy and necessity to simulate larger and more complex systems accurate simulation of a single design of a given system may be as long as several hours days or even weeks which often makes design automation using conventional methods impractical or even prohibitive additional problems include numerical noise often present in the simulation data possible presence of multiple locally optimum designs as well as multiple conflicting objectives in this edited book various techniques that can alleviate solving computationally expensive engineering design problems are presented one of the most promising approaches is the use of fast replacement models so called surrogates that reliably represent the expensive simulation based model of the system device of interest but they are much cheaper and analytically tractable here a group of international experts summarize recent developments in the area and demonstrate

applications in various disciplines of engineering and science the main purpose of the work is to provide the basic concepts and formulations of the surrogate based modeling and optimization paradigm as well as discuss relevant modeling techniques optimization algorithms and design procedures therefore this book should be useful to researchers and engineers from any discipline where computationally heavy simulations are used on daily basis in the design process

construction will always be needed and will always consume resources in developing an approach for assessing sustainable building the three step strategy in the netherlands named trias ecologica has proven to be useful this title looks at this strategy

diploma thesis from the year 2008 in the subject business economics business management corporate governance university of applied sciences kufstein tirol language english abstract the world is constantly changing particularly in booming industries such as logistics globalisation increased outsourcing customers demand for global coverage and integrated services are just a few examples of how the external environment affects logistics companies based on an external audit for logistics companies with focus on competitive forces the thesis answers three main questions which step by step answer the main question of how logistics companies should react to the changes in the external environment firstly based on market estimates about future growth rates of the industry it is assessed whether a growth strategy is a feasible grand strategy for logistics companies the outcome is that the logistics industry is booming and therefore a growth strategy is feasible secondly it is assessed whether mergers and acquisitions m a are a feasible growth option by conducting an event study of logistics m a transactions for the past decade the results show that it can not be proven that logistics m a destroy value for the acquirer and in some cases it can even be proven that they enhance the value of the acquirer therefore it can be concluded that m a are a feasible growth option for logistics companies thirdly the main challenges for logistics companies from the external environment and the implications for their m a strategy are discussed the largest challenges within the industry include the rise of bric countries and the integration of freight forwarding and contract logistics an expansion to china for example is mainly done organically due to the lack of suitable takeover targets while the combination of freight forwarding and contract logistics is often done through m a capital markets react positively to an integration of the two industries and strategic reasons support this combination too shipping lines and railway companies are expanding into logistics competing with logistics companies for the business as well as in m a tenders a key in the logistics industry is to get direct access to customers shipping lines and railways expanding into logistics and freight forwarders expanding into contract logistics are examples of securing access to customers to realise cross selling potentials
