this textbook presents a modern treatment of fundamentals of heat and mass transfer in the context of all types of multiphase flows with possibility of phase changes among solid liquid and vapor it serves equally as a textbook for undergraduate senior and graduate students in a wide variety of engineering disciplines including mechanical engineering chemical engineering material science and engineering nuclear engineering biomedical engineering and environmental engineering multiphase heat transfer and flow can also be used to teach contemporary and novel applications of heat and mass transfer concepts are reinforced with numerous examples and end of chapter problems a solutions manual and powerpoint presentation are available to instructors while the book is designed for students it is also very useful for practicing engineers working in technical areas related to both macro and micro scale systems that emphasize multiphase multicomponent and non conventional geometries with coupled heat and mass transfer and phase change with the possibility of full numerical simulation

this book deals with certain aspects of material science particularly with the release of thermal energy associated with bond breaking it clearly establishes the connection between heat transfer rates and product quality the editors then sharply draw the thermal distinctions between the various categories of welding processes and demonstrate how these distinctions are translated into simulation model uniqueness the book discusses the incorporation of radiative heat transfer processes into the simulation model

climate change is one of the most important environmental problems faced by planet earth the majority of co₂ emissions come from burning fossil fuels for energy production and improvements in energy efficiency shows the greatest potential for any single strategy to abate global greenhouse gas ghg emissions from the energy sector energy related emissions account for almost 80 of the eu s total greenhouse gas emissions the building sector is the largest energy user responsible for about 40 of the eu s total final energy consumption in europe the number of installed air conditioning systems has increased 500 over the last 20 years but in that same period energy cooling needs have increased more than 20 times the increase in energy cooling needs relates to the current higher living and working standards in urban environments with low outdoor air quality the general case this means that in summer time one cannot count on natural ventilation to reduce cooling needs do not forget the synergistic effect between heat waves and air pollution which means that outdoor air quality is worse in the summer aggravating cooling needs over the next few years this phenomenon will become much worse because more people

will live in cities more than 2 billion by 2050 and global warming will aggravate cooling needs an overview of materials to lessen the impact of urban heat islands excellent coverage of building materials to reduce air conditioning needs innovative products discussed such as thermo and electrochromic materials

heat transfer calculations in different aspects of engineering applications are essential to aid engineering design of heat exchanging equipment minimizing of computational time is a challenging task faced by researchers and users methodology of calculations in some application areas are incorporated in this book such as differential analysis of heat recoveries with cfd in a tube bank heating and ventilation of equipment and methods for analytical solution of nonlinear problems numerical analysis is the prerequisite of design and for the manufacture of heat exchanging equipment some numerical and experimental information are presented with utmost skill similarly the analytical solution of heat transfer is touched in this book study of heat transfer phenomena and applications are equally emphasized in this issue

climate change is a major challenge facing the modern world the chemistry of air and its influence on the climate system forms the main focus of this monograph the book presents a problem based approach to presenting global atmospheric processes evaluating the effects of changing air composition as well as possibilities for interference within these processes and indicates ways for solving the problem of climate change through chemistry the new edition includes innovations and latest research results
